SUMMARY

Software engineer on a production multi-tenant SaaS, working across test automation, CI/CD and AWS cloud infrastructure. Strongest where the build system meets reliability: making test suites fast and trustworthy with Playwright and Vitest, keeping GitHub Actions pipelines green, and tracing production failures from root cause to a shipped fix.

SKILLS

CI/CD & Automation: CI/CD (continuous integration / continuous delivery), GitHub Actions, pipeline design, build automation, Docker, containerization, pre-push hooks, smart test selection, coverage-baseline gating, workflow automation (n8n)

Testing & QA: Playwright, Vitest, Jest, end-to-end (E2E) testing, unit testing, integration testing, regression testing, cross-browser testing, test automation frameworks, flaky-test stabilization, code coverage reporting, video-recorded failure capture

Cloud & Infrastructure: AWS (Lambda, S3), Terraform, infrastructure as code (IaC), serverless, Linux, Bash, multi-tenant SaaS architecture

Languages: TypeScript, JavaScript, Python, SQL, C/C++

Application Stack: Next.js, React, React Native, Node.js, tRPC, Prisma, PostgreSQL, REST APIs

EXPERIENCE

Software Engineer — Test & CI Infrastructure

FundMiner | Remote | Aug 2025 – Present

- Merged 109 pull requests in six months and shipped the majority of all company-wide test and CI breakage fixes by commit volume.
- Designed and shipped an internal test-reporting and coverage dashboard from scratch, now used daily across the engineering organization: S3-backed run storage, per-layer coverage tracking, regression trend charts, and a flaky/failing-test triage panel.
- Migrated the test framework from Jest to Vitest and Playwright, added video-recorded end-to-end failure capture, and stabilized dozens of previously flaky specs.
- Rebuilt the organization's CI pipelines in GitHub Actions — standardized reusable workflows, coverage-baseline enforcement, automated PR labeling and stale-PR detection — and integrated GitHub, Linear and Microsoft Teams into a single triage surface.
- Containerized the full test suite in Docker — Vitest unit tests and Playwright E2E — so an identical run works on any developer machine and in CI, and shipped a pre-push hook with changed-file test selection; adopted team-wide.
- Resolved parallel-worker race conditions in a production job-queue system (PostgreSQL row-locking contention, slot-limit invariants) and instrumented isolated worker threads with Sentry so job failures stopped being silently dropped.

AI Engineer

Inode Technology | Ciudad Juárez, MX | Jul 2025 – Aug 2025

- Built machine-learning-based automation tools in Python for structured content and code generation, automated internal development workflows with n8n, and developed a client-facing mobile application in React Native with a Node.js backend.

Software Developer

Presidencia Municipal (Ciudad Juárez city government) | Ciudad Juárez, MX | Mar 2025 – Jul 2025

- Built Python automation for customized PDF generation, cutting manual effort by 90%, and integrated REST APIs to automate database operations.
- Built a real-time usage dashboard in React tracking active users per government department.

PROJECTS

KaliQA — static analysis CLI for test suites

Undergraduate thesis, in progress | TypeScript, ts-morph

- Building a CLI that statically analyzes Playwright and Vitest suites, detects test smells against published detection rules, and reports test-quality metrics.

EDUCATION

B.S. Computer Systems Engineering

Universidad Autónoma de Ciudad Juárez (UACJ) | Ciudad Juárez, Mexico | Expected 2027

- Algorithms and data structures instructor, university competitive programming club; ICPC contestant.
