

ABDEL PEREZ

Platform & Test Infrastructure Engineer — CI/CD · Observability · Reliability

Remote (Mexico, GMT-6/CT) | a1rlay@outlook.com | +52-656-697-7675 | github.com/A1rlay | linkedin.com/in/abdelperez

SUMMARY

Engineer who owns test/CI infrastructure and observability end-to-end on a production multi-tenant SaaS. Built an internal testing platform from scratch that's now a daily driver for the whole engineering org, Dockerized the entire test stack, and fixed production reliability issues (job-queue race conditions, silent worker failures, XSS/security gaps). Comfortable working remote and async, owning problems from root cause to shipped fix.

EXPERIENCE

Software Engineer (Internship) — FundMiner

Aug 2025 – Present · Remote

- Designed and shipped an internal testing/observability dashboard from scratch, now used daily across the engineering org — S3-backed run architecture, trend charts, per-layer coverage tracking, and a flaky/failing-test triage panel.
- Migrated the entire test stack to Docker and built a pre-push hook with smart test selection (changed-file-based unit vs. full E2E), cutting wasted local and CI test time.
- Overhauled GitHub Actions CI: standardized workflows, added a coverage-baseline job, and automated PR labeling/stale-PR flagging; integrated GitHub, Linear, and Teams into the testing dashboard for triage.
- Fixed a long tail of parallel-worker race conditions in a production job-queue system (Postgres row-locking contention, slot-limit invariants) and wired Sentry into isolated worker threads to stop job failures from being silently dropped.
- Ran a full XSS audit and closed multiple URL-validation bypasses (moved substring checks to hostname-based validation) across the application.
- Migrated the test framework from Jest to Vitest + Playwright, including video-recorded E2E failure capture, and stabilized dozens of previously flaky specs.

AI Engineer — Inode Technology

Jul 2025 – Sept 2025 · Ciudad Juárez, MX

- Built ML-based automation tools in Python for structured content and code generation.
- Automated internal development workflows using n8n; developed a client-facing mobile app with React Native and Node.js.

Software Programmer — Presidencia Municipal

Mar 2025 – Jul 2025 · Ciudad Juárez, MX

- Built automation scripts for customized PDF generation, cutting manual effort by 90%; integrated REST APIs to automate database operations.
- Built a real-time usage dashboard (ReactJS) tracking total users per government dependency.

SKILLS

CI/CD & Automation: GitHub Actions, Docker, pre-push/smart test selection, CI pipeline design, workflow automation (n8n)

Testing & QA Tooling: Playwright, Vitest/Jest, E2E + video-recorded failure capture, flaky-test stabilization, coverage/regression dashboards

Reliability & Security: Sentry, job-queue/concurrency debugging, PostgreSQL row-locking, XSS auditing, URL-validation hardening

Cloud & Infra: AWS S3, multi-tenant SaaS architecture, Linux

Languages: TypeScript, JavaScript, Python, SQL, C/C++

Application Stack: Next.js, React, Node.js, tRPC, Prisma, PostgreSQL

Dev Workflow: Git, Neovim, Docker

EDUCATION

Bachelor of Computer Systems Engineering — Universidad Autónoma de Ciudad Juárez, Expected 2027

DSA instructor & representative, university algorithmic club; ICPC contestant (Codeforces, AtCoder, HackerRank).
